

Supervisor Feedback Response

Bundoora Family Clinic - Digital Prescription and Medication Tracking Management System (DPMTMS)
Final SRS / Project Response to Supervisor Feedback

Purpose

This document records the significant feedback received from the project supervisor and explains the actions taken by the group in response. The responses are intended to demonstrate that the feedback was reviewed carefully and incorporated into the final project work and SRS where applicable.

Feedback Response Summary

Supervisor Feedback	Group Response / Action Taken	Outcome / Justification
Final SRS feedback requirement: The group should clearly document the feedback received from the supervisor, explain how the team responded to each significant point, and provide justification where a recommendation was not implemented. A table format was recommended, and the responses should be consistent with the final SRS.	We added a structured supervisor-feedback response section for the final submission. Each significant comment is recorded together with the corresponding group action and the resulting outcome or justification. The group also reviewed the final SRS to ensure that the documented responses match the changes reflected in the submitted project work.	The feedback is now presented in a clear and traceable format. This makes it easier for the supervisor/lecturer to verify how feedback influenced the project and demonstrates that the group considered the comments as part of the finalisation process.
Task completion and repository evidence: The supervisor acknowledged that the tasks had been created and allocated appropriately, but noted that completed work could not be found in the <i>Done</i> column or repository. The group was instructed to upload completed work to the repository as discussed in class.	The group reviewed the task board and repository workflow. Completed deliverables are being moved to the <i>Done</i> column only after the associated work has been completed and uploaded to the project repository. This ensures that the board status corresponds with actual evidence of completion in the repository.	This improves project traceability and makes completed work easier to verify. It also aligns task-management evidence with repository evidence rather than relying only on the status shown on the project board.
Issue closure: The supervisor specifically requested that an issue be closed after it is moved to the <i>Done</i> column and reminded the team not to forget the repository upload.	The group adopted a completion sequence for relevant tasks: complete the assigned work, upload/commit the deliverable to the repository, move the task to <i>Done</i> , verify that the repository contains the final work, and then close the corresponding issue.	This prevents issues from remaining open after completion and provides a consistent audit trail between task allocation, completed work, repository evidence, and issue closure.

Response Statement

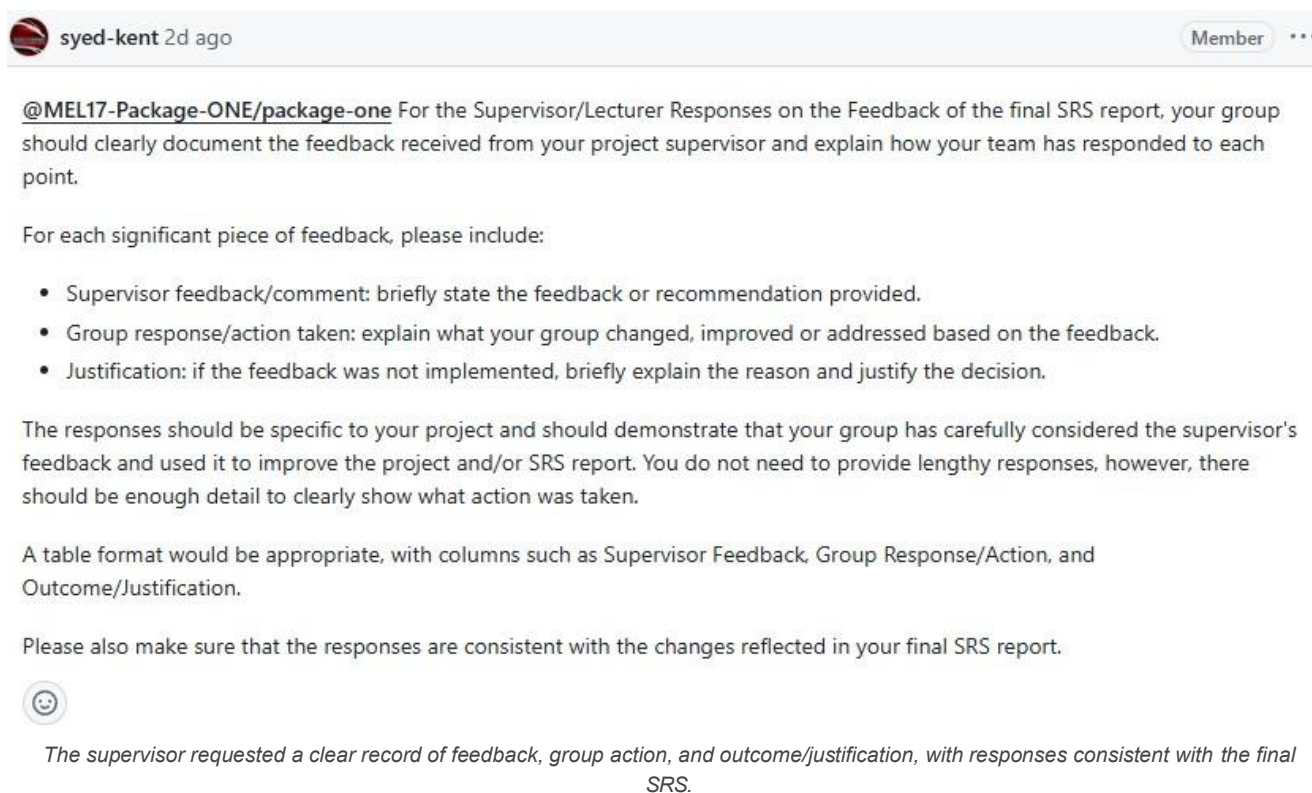

The group appreciates the supervisor's feedback and has used it to strengthen both the project management process and the final SRS documentation. In particular, the team has improved the traceability of completed work by ensuring that task-board status, repository evidence, and issue closure are kept consistent. The final submission also documents the supervisor feedback and the group's response in a concise table so that the actions taken can be reviewed clearly.

Where feedback requires an ongoing project-management action, the group will continue to follow the agreed workflow through the final submission stage: completed work will be uploaded to the repository, moved to the *Done* column, checked for evidence, and the related issue closed.

Evidence of Supervisor Feedback

The following screenshots are included as supporting evidence of the supervisor's comments.

[@MEL17-Package-ONE/package-one](#) For the Supervisor/Lecturer Responses on the Feedback of the final SRS report, your group should clearly document the feedback received from your project supervisor and explain how your team has responded to each point.

For each significant piece of feedback, please include:

- Supervisor feedback/comment: briefly state the feedback or recommendation provided.
- Group response/action taken: explain what your group changed, improved or addressed based on the feedback.
- Justification: if the feedback was not implemented, briefly explain the reason and justify the decision.

The responses should be specific to your project and should demonstrate that your group has carefully considered the supervisor's feedback and used it to improve the project and/or SRS report. You do not need to provide lengthy responses, however, there should be enough detail to clearly show what action was taken.

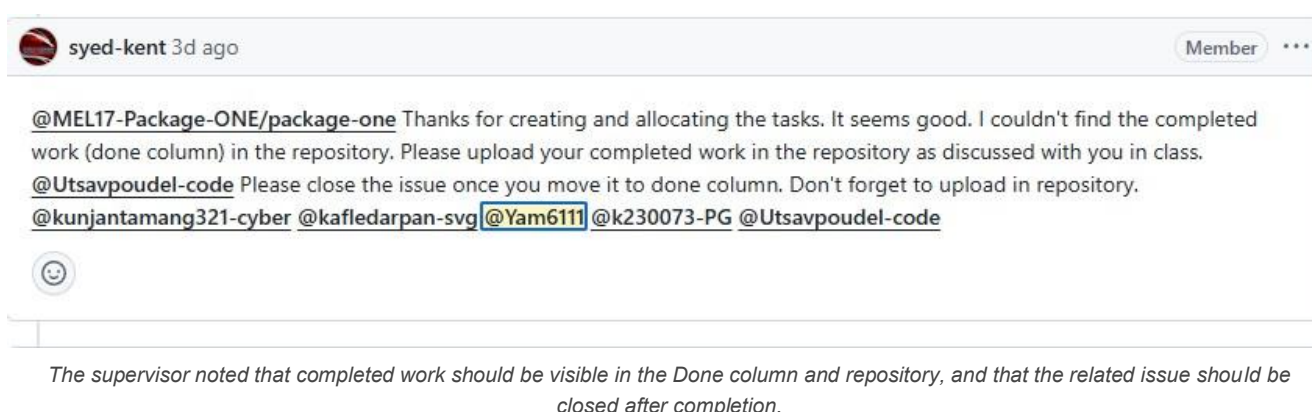

A table format would be appropriate, with columns such as Supervisor Feedback, Group Response/Action, and Outcome/Justification.

Please also make sure that the responses are consistent with the changes reflected in your final SRS report.

The supervisor requested a clear record of feedback, group action, and outcome/justification, with responses consistent with the final SRS.

[@MEL17-Package-ONE/package-one](#) Thanks for creating and allocating the tasks. It seems good. I couldn't find the completed work (done column) in the repository. Please upload your completed work in the repository as discussed with you in class.

[@Utsavpoudel-code](#) Please close the issue once you move it to done column. Don't forget to upload in repository.

[@kunjantamang321-cyber](#) [@kafledarpan-svg](#) [@Yam6111](#) [@k230073-PG](#) [@Utsavpoudel-code](#)

The supervisor noted that completed work should be visible in the Done column and repository, and that the related issue should be closed after completion.
